

Name: _____

Brown Bears

By Guy Belleranti

My hiking partner and I are trekking through Montana's Glacier National Park. Suddenly, we stop in our tracks. On the trail just ahead, a grizzly bear cub is scratching on a tree trunk. The cub's mother stands beside it. I feel awe, then a little fear. Getting this

A Kodiak brown bear catches a fish to eat.

Some Kodiaks get huge, about the size of polar bears.

Brown bears live in more habitats than any other bear. Some, like the Kodiak, live by the coast. Others, like the grizzly, live in forests and mountain meadows. Some even live in the Arctic tundra.

At one time, brown bear territory included most of North America,

Asia, Europe, and the Middle East. Unfortunately, habitat loss, overhunting, and killing out of fear have reduced their numbers. Today, North American brown bears are primarily in Alaska and western Canada. A few northwestern U.S.

states still have some as well, especially in or near national parks and other protected areas.

Brown bears are omnivores. They eat plants, nuts, berries, insects, rodents, fish, deer, and even carrion (dead animals). The bears' eating habits have an important impact in the ecosystem where they live. They carry seeds to other locations in their scat (waste) and fur. They also help keep deer and other animal populations under control.

Some people get brown bears and black bears confused because brown bears aren't always brown and black bears aren't always black. So how can you tell them apart? Well, brown bears are larger and have a muscular shoulder hump. They also have longer and straighter claws. The hump and claws provide strength,

spawning fish. They also come together to breed.

And, of course, mothers spend large amounts of time with their cubs. Mothers have one to four cubs, but most often two. The cubs are born blind, hairless, and tiny. They weigh only about one pound. They sleep next to their mother and grow quickly from her milk. After two to three years, they are ready to live on their own.

Name: _____

Brown Bears

9. _____ spawning i. animals that eat both plants and other animals for food
10. _____ coast j. spending time alone

Name: _____

Brown Bears

By Guy Belleranti

In the article, "Brown Bears," you learned that in the past, brown bears lived throughout most of North America, Asia, Europe, and the Middle East. Today there are fewer brown bears because their populations have been reduced by habitat loss, overhunting, and killing out of fear. Now brown bears can mostly be found in and around national parks
